

## IT Change Management Procedure

The IT Change Management Procedure outlines the steps to be taken when implementing changes to the company's technology infrastructure. Any production change, including software updates, hardware modifications, or configuration adjustments, must undergo a thorough review and approval process before deployment. As described under the Acceptable Use of Company Technology Policy, all changes must align with the company's overall IT strategy and not compromise the security or integrity of our systems.

Before any production change can be implemented, an IT Change Request (ITCR) form must be submitted to the designated change management team. The ITCR form will include a detailed description of the proposed change, its expected impact on the system, and a rollback plan outlining the steps to be taken in case of failure or unintended consequences. This rollback plan is a critical component of our change management process, as it ensures that we can quickly and effectively revert to a known good state if necessary.

As part of the change management process, all production changes must also meet the requirements outlined under the Password and Credential Management Standard. Specifically, any changes that involve modifying or updating user credentials must be carefully planned and executed to minimize the risk of unauthorized access or security breaches. In addition, emergency changes may still require retroactive review by the Change Board within 48 hours of deployment, as described under the Emergency Response Policy.

Once a production change has been approved and implemented, it is the responsibility of the IT team to monitor its impact on the system and ensure that it does not cause any disruptions or errors. The IT team will also be responsible for maintaining accurate records of all changes made to the system, including documentation of the rollback plan and any subsequent changes.

In the event of a change-related issue or emergency, the IT team must notify the Change Board immediately, who will then convene an emergency meeting to review the situation and determine the best course of action. The Change Board's decision will be based on the recommendations of the IT team, as well as input from other relevant stakeholders, such as security and compliance teams.

By following this change management procedure, we can ensure that our technology infrastructure is managed in a secure, efficient, and effective manner, while also minimizing the risk of disruptions or errors.
