

Engineering On-Call Rotation Policy

The Engineering On-Call Rotation Policy outlines the procedures for managing on-call shifts among the infrastructure engineering team. The rotation is designed to ensure that all engineers have an equal opportunity to participate in on-call duties, while also providing adequate coverage for critical systems and services. As described under the 'Gift and Entertainment Acceptance Policy', any gifts or entertainment provided by vendors or contractors to on-call engineers must be reported and approved through this policy's procedures.

On-call shifts rotate weekly among team members, with each engineer serving a one-week period as the primary point of contact for critical issues. During their shift, on-call engineers are expected to be available 24/7 and respond promptly to any pages or alerts. As stated under the 'Independent Contractor Classification Policy', contractors working on-site must be properly classified and cleared through this policy's procedures to ensure compliance with relevant regulations.

When responding to a page, on-call engineers must acknowledge receipt of the alert within 10 minutes. This acknowledgement is critical in ensuring that the issue is properly documented and escalated to the relevant teams. Failure to respond within the allotted time may result in delays or complications in resolving the issue. As described under the 'Code of Conduct Policy', all employees are expected to adhere to this standard when responding to on-call duties.

In the event of an emergency or critical incident, the on-call engineer is responsible for coordinating with other teams and stakeholders to resolve the issue as quickly and efficiently as possible. This may involve working closely with colleagues, vendors, or external partners to ensure that the issue is properly addressed. As stated under the 'Confidentiality and Data Protection Policy', all employees are expected to maintain confidentiality when handling sensitive information related to critical systems or services.

By following this policy, the infrastructure engineering team can ensure that on-call duties are managed effectively, while also maintaining compliance with relevant regulations and company policies.
