

Physical Facility Access Control Policy

Physical Facility Access Control Policy

The physical facility access control policy is designed to ensure that all employees, visitors, and contractors have secure and authorized access to company facilities and equipment. As described under the Intellectual Property Assignment Policy, sensitive equipment such as servers and data storage devices are located in secure areas that require restricted access. To maintain the confidentiality and integrity of these assets, badge access to server rooms is limited to designated infrastructure staff who have been granted the necessary clearance and training.

Visitors to company facilities are required to be escorted at all times when within secure areas, including server rooms, data centers, or other sensitive locations. This policy aligns with the Employee Social Media Conduct Guidelines, which emphasize the importance of maintaining confidentiality and avoiding disclosure of sensitive information in public forums. Visitors who fail to comply with this requirement may be subject to revocation of their access privileges.

Authorized personnel are responsible for ensuring that all visitors and contractors adhere to these access control policies. This includes verifying visitor badges and escorting them at all times when necessary, as well as monitoring access logs to detect any unauthorized activity. The facility management team is also responsible for conducting regular security audits to identify vulnerabilities and implement corrective measures.

In the event of an emergency or unexpected situation, authorized personnel may grant temporary access to secure areas under the supervision of a designated representative. However, this access must be strictly limited to those who have been properly cleared and trained, and all necessary precautions must be taken to prevent unauthorized disclosure of sensitive information.
