

## Software License Compliance Policy

All software installed on company-owned devices or accessed through company-provided networks must be properly licensed and tracked in the central license inventory. This ensures compliance with applicable laws and regulations, as well as adherence to our Workplace Health and Safety Policy, which requires employees to report any hazards or risks associated with software usage. The use of unlicensed software poses significant risks to employee health and safety, as well as potential liability for the company.

In order to maintain a secure and compliant environment, all installed software must be properly licensed and tracked in the central license inventory. This includes all software applications, operating systems, and other digital tools used by employees. Any software found to be unlicensed during an audit will be removed from the system within 5 business days, as outlined under our Litigation Hold and Records Preservation Procedure, which requires the preservation of all relevant records, including software licenses.

As part of our ongoing commitment to compliance, we will conduct regular audits to ensure that all installed software is properly licensed. These audits will also provide an opportunity for employees to report any concerns or issues related to software usage. In the event of a non-compliant software installation, the IT department will work with the relevant employee or department to resolve the issue and bring the system into compliance.

It is the responsibility of all employees to ensure that their software usage complies with our Software License Compliance Policy. This includes reporting any changes to software installations, as well as verifying that all necessary licenses are in place before using new software applications. By working together to maintain a compliant environment, we can minimize the risk of non-compliance and ensure a safe and secure workplace for all employees.
